

TMA designed the height limiter, for working under overhead power lines, under buildings and other height limitations. Model 1 and Model 2 are simple limiters based on the angle detection of the main boom (model 1) and the hydraulically adjustable boom (model 2).

Operation of the system is easy. By pressing on the top blue up or down button, in conjunction with turning the adjustment lock key, the operator can alter the max. height, which is shown on the digital display. When the actual height reaches 90% of the adjusted height the yellow warning will come on and when the max. height is reached, the red light will come on and the upwards movement is stopped.

In case of a mono block boom only one angle is detected and the height is calculated accordingly. In case of an adjustable boom, two angles are detected and the maximum height is calculated from these angles.
